

## **Aesthetic Medicine - Bionblue**

Bionblue is a filler recently introduced on the market that gives natural and more lasting results than any other fillers (filling).

It is a derivative from polyvinilic alcohol, with a degree of purity equal to 99% and for its incapacity to develop immune reactions is used in medicine as vehicle for drugs or substitute for plasma.

It has many features really appreciated in aesthetic medicine:

- it does not have proteins that can provoke allergies
- it does not have bacterial origin
- it is completely reabsorbable even if rather slowly.

In fact it is slowly degraded in natural elements, as water and carbon dioxide, by mitochondria.

The average duration can reach a year.

Bionblue can be used for:

- Nasogenian furrows
- Increase of lips.
- Increase and regularization of cheekbones

It can also be used for minor calibre wrinkles, but in this case I prefer to use materials as hyaluronic acid or collagen.

It can give a discreet oedema (swelling) when lips are treated.

As a rule it goes away in 12 – 24 hours

Lately, however, this collateral effect is more and more rarely noticed.
